Chapter I

METHODOLOGICAL ASPECTS AND INFORMATION ON THE INDICATORS

A. INTRODUCTION

It was considered desirable to group here in systematic form the principal statistics and indicators dealt with in Parts One and Two of this document, which, in essence, represent the quantitative bases of the reviews and studies carried out in the Second Regional Appraisal of the International Development Strategy (IDS). An analysis of the criteria used in selecting the indicators, of their significance and the analytical concepts characteristic of them, and of the sources of information used, as well as study of the statistical value of the relevant data precede the tables in question.

The indicators have been classified and grouped taking account of the broad subjects dealt with in the IDS, and, in particular, the plan of this document. An effort was also made in establishing these classifications to collect information on the basis of the interrelations existing between the various economic and social variables to which the indicators refer.

This offers a comprehensive quantitative view for examining and interpreting the development process through its principal aspects: economic growth, human and social development, internal effort, and trends in external relations, mainly as regards to trade and financing.

B. CRITERIA USED IN THE SELECTION OF INDICATORS

The appraisal raises a series of questions in connexion with the manner in which it ought to be organized and presented. A basic issue is the need for a simplified aggregate view of the operation of the development process, since its reorientation by the government authorities is usually seen in such terms. This leads to the need to define a group of synthetic indicators of the operation of the process, a subject discussed at length in the past, and one which has cropped up again with singular insistence in recent years. Its re-emergence is not fortuitous, since it has arisen, to a great extent, as a result of the pattern recently set by the appraisal task, and is basically connected with the definition of the ultimate objectives towards which one seeks to direct the development process. Although this subject will be dealt with again further on, it ought to be stated beforehand that owing to the serious difficulties which stand in the way of reducing the different aspects of the development concept to a representative average of the activities or situations of social organization in general, preference was given to the use of a group of indicators, thereby avoiding having to define an abstract synthetic index.

The homogeneity criteria used to ensure that the indicators are representative are also a source of concern. Although in the definition of areas of interest possibilities are unlimited insofar as the selection of participation or aggregation criteria are concerned (both from the standpoint of synthetic indicators or from that of the individual level of the agents of the process) it would seem pertinent to identify the basic conditions which must be met for selecting an indicator, apart from its political or analytical importance, its reliability, accuracy and comparability, namely, that it must satisfy the homogeneity criteria, in respect of both the type of phenomena natural to an area (production, education, etc.), and the agents participating in it (the productivity of enterprises, the

social group to which students belong, etc.). This problem of homogeneity is of special relevance for Latin American countries since a usual attribute of these countries is their persistent and pronounced structural heterogeneity, as a result the identification of homogeneous groups or characteristics would make a clear contribution to a better interpretation of their functioning.

The third matter of importance in the design of indicators is the ability to reflect their interrelation clearly. Although it is possible to choose diverse areas of interest, what is under observation is a single social process, therefore, the identification of characteristics and sectors which can be analysed simultaneously in the different areas seems a basic condition for a fruitful review of their performance. There is a traditional sectoral division in the field of economic activity which permits, for example, the simultaneous observation, in interrelated manner, of the performance of the agricultural sector as a producer, user of income and investor, as well as in its relations with the remainder of the economy in each of those cases; but it is clear that a similar tradition does not exist in the analysis of the behaviour of individuals or households in the so-called social aspects of the development process. Defining the characteristics of social groups, and their identification by their participation or attitudes in different areas of interest seems to constitute a source of indicators for a better understanding of their behaviour and aspirations. In turn, such a definition of characteristics can make a contribution to the choice of pragmatic criteria for the definition of extreme poverty or similar concepts.^{1/}

The fourth problem in respect of the design of indicators refers to the statistical methods which can be used for their calculation, the practical possibility of preparing them, and their definition in time. With respect to the first point, although it is

^{1/} A recent example in this connexion is the study Map of extreme poverty in Chile, Universidad Católica de Chile, background document N° 29, November 1974.

true that, in a wide sense, it is possible to call any observed characteristic of a phenomenon an indicator, the term must be applied in its strictest sense to those observed characteristics which can be expressed numerically. Such observations can be simple indicators or basic data (for example, the number of persons living in a given area), secondary indicators, or, those derived from primary data through a series of simple or complex calculations, such as the gross product or life expectancy. Even though the distinction between one and the other is in many cases difficult to draw, examples could be given of simple indicators such as proportions, variation rates, measures of intensity and measures of position or tendency; within the synthetic indicators, aggregate index numbers, probably the most widely used method in economic analysis, and in respect of social aspects, the concept of life expectancy. Although it is customary to use this last method for estimating the number of years that a person may, on average expect to live, there is no surfeit of reasons why this use cannot be extended to other fields of analysis. It is possible, for example, to think of a breakdown of the life cycle, in terms of certain activities which may be engaged in during the cycle, and in the resulting definition of indicators which measure them. However, it ought to be borne in mind that a significant difference between aggregate index numbers and expectations of life results from the fact that the former contain elements weighted in accordance with some valuation criterion, whereas the latter do not. This is a typical example of the limits which exist today in the construction of indicators on the economic and social aspects of the development process.

As regards the time frequency of indicators it is difficult to generalize, but it ought to be noted that there is a continuous tendency to define smaller and smaller periods as modules of the system. The preparation of quarterly national accounts, or the implementation of permanent sample surveys during intercensal periods

/are typical

are typical examples of preoccupations in this connexion. But in this case, it should also be noted that the growth rate in data production observed in recent years has not been matched by an equivalent increase in their publication, and much less so by their publication within a reasonable period.

It is obvious that the definition of a group of indicators is a function of the availability of basic data, but it is also true that the generation of basic information is a process which is subject to continuous evaluation and reorganization. The definition of indicators, the identification of areas of interest, and the use of statistical systems as structures for guiding the tapping of basic data is probably one of the most efficient ways of determining priorities in statistical plans.

C. THE APPRAISAL OF THE OVERALL PERFORMANCE OF THE DEVELOPMENT PROCESS

The overall appraisal requires, as was pointed out, the definition of an indicator, or a small group of synthetic indicators, of the operation of the development process by virtue of which it could be described.

Among such aggregate indicators, the one most commonly used is the product, in any of its aspects: national or domestic, gross or net, limited to material goods, extended to all mercantile transactions, or to the latter plus estimates of non-commercial government services, or household activities. Whatever its nature, the product always refers to a group of goods produced, free of duplication - taken either as final goods or as the net production of the different sectors of activity - and the income resulting from the production process in which they originate.

As far as the optional suggestions on objectives and styles of development are concerned there have emerged in recent years discussions on the representative nature of the product as an indicator of the benefits stemming from production of those goods. Given the particular

level allocated in the hierarchy to this concept as an indicator of the growth of production and economic development, it seems opportune here to salvage the main arguments of this discussion, insofar as they can be used to support the opinions expressed on the appraisal.

The strict theoretical conditions under which the product can be used as a comparative index of the well-being of the population are well known and entail the assumption that the effects of variations in preferences, prices, and particularly in the distribution of income and access to the various goods and services which make up the final demand basket of the economy, are either non-existent or neutral. Moreover, positions have been taken in connexion with two major problems. One is the scope of the concept of the product, which includes three aspects: the definition of the boundaries of economic activity, the concept of the net or final product, and the criteria of valuation or weighting. The other is the weakness of the product as an indicator of the form in which the goods and services, whose production it values, have been distributed. The scope of the concept of the product constitutes a problem of a practical and technical nature which will not be discussed in this document.^{2/}

As regards the problems of distribution, it is obvious that the global product of the economy does not offer any indication as to the form in which the goods produced and the income generated have been distributed, neither does it point to differences between totally different situations. It is for this reason that in any appraisal attempt an indicator of position, which the product is from the statistical point of view, should be accompanied by dispersion measures, or complementary information to make it possible to establish

^{2/} See in this connexion document "The organization of information for the development appraisal" (ST/CEPAL/Conf.49/L.2) prepared by the consultant Mr. Juan Sourrouille for the Seminars on the Review and Appraisal of the International Development Strategy: the organizational problems raised by this task in the countries of Latin America.

relative positions with respect to the different sectors. The question is however, somewhat more complex, since it is not enough to know that a given concentration exists in the organization of production or in the distribution of income, but it would also be desirable to know what positions are occupied at any given moment by the different social groups, to monitor their movements over the course of time. From this point of view, the automatic aggregation implied by the presentation of global indicators, including the coefficients of concentration or dispersion which treat production, income or consumption as a homogeneous monetary mass do not go very far in providing an answer to the problem.

The solution will probably be to seek the presentation of data in such a way that its perusal would give a clear indication of groups of agents directly identifiable in society, rather than arbitrary or abstract constructions, the best example of which are the fractiles of the population determined by their position in the structure on the basis of a given attribute.

It would be in keeping with this line of thought to suggest the desirability of incorporating in the economic statistics classifications of an institutional type which depend on the legal form that the producers' organization takes, through which a distinction can be made between the public and private sectors, and within the private sector between those organizations in which the entrepreneurial risk is distinct from personal risk and those in which this is not so. A further division along these lines is that of making a distinction between the joint-stock companies of the country and those which are subsidiaries of foreign-owned companies.

This criterion of classification would help in bringing about a better understanding of the operation of the economic system by facilitating a view of essential aspects, such as information on the volume of production absorbed by self-suppliers, the relative importance of independent producers in the total supply of goods and services, or the degree of concentration which exists in markets dominated by a

small number of enterprises, particularly when their policy does not correspond to the guidelines established in the country in which they operate. On the basis of this criterion, the presentation of data depends on the characteristics of the actual groups which participate in the productive process, and a pre-requisite in such a case would be an identification of agents on the basis of the legal form of organization, as well as the traditional criteria of types of goods produced. Its utility is particularly clear if one desires to evaluate the impact of the use of the traditional instruments of economic policy (allocation of credits, taxes, export incentives, import tariffs, etc., as a whole) on determined economic groups; it can also be used to determine priorities with a view to the allocation of resources between alternative investment projects likely to be carried out by public, local, or foreign interests, and in the analysis and control of prices and supply policy of those goods, in particular, which because of market conditions may be considered of critical importance.

The possibilities of measuring both the level of production and the relative participation of groups thus defined are to a large extent real. In fact, both the public sector, particularly in its entrepreneurial aspect, as well as the joint-stock companies have complete accounting records, to which public access is usually guaranteed by the laws governing such bodies. The use of traditional profit and loss, and trading accounts should, therefore, be given a priority which they do not have today in the preparation of economic data, as can be seen from the indicators presented, and as such could become one of the important sources of information for the appraisal exercise.

This way of observing the productive process would help, moreover, to facilitate the review of some particularly interesting recent aspects of the Latin American development process, which are related to the changes in the form in which economic activity is organized, and their impact on the distribution of income. By way of example,

/it ought

it ought to be mentioned that the appearance of large transnational enterprises, the expansion of the radius of action of public enterprises and the transformation of one-man businesses into share companies, a phenomenon of some importance in the last decade, probably brings about a greater concentration of the production apparatus, and apparently diminishes inequality measured in terms of the concentration of personal income. This apparent contradiction is due to the fact that the profits from enterprises of this type, owing to their ownerships structure, only form a very small part of the total amount of personal income, whereas the salaries of their executives are now to be found in the highest strata of distribution, although in their totality they do not come up to the figure represented by profits. The application of these criteria to the analysis of income distribution would help to identify with greater accuracy the links between a position in terms of magnitude of income and a given place in the productive apparatus.

D. CLASSIFICATION AND CRITICAL ANALYSIS OF INDICATORS USED

The indicators are grouped by areas of interest which correspond approximately to the scheme of analysis and interpretation used in Parts One and Two of this document, to facilitate reading and to allow the expert the possibility of concentrating on the sections of interest to him.

The value of the indicators have been calculated for each one of the countries and for the region as a whole. This has made it possible to have two types of presentation. On one hand, there are tables in which the various indicators with exclusively regional values are included, and through which an attempt is made to show the evolution over time of an interrelated group of variables which make up a specific subject of analysis. On the other hand, there are tables dedicated exclusively to one indicator, showing its value both for the region and for each one of the countries. Regional

value serves in these latter cases as a benchmark; from the point of view of absolute values, showing national participation in the regional whole, and from the point of view of averages, showing the distribution of the countries around the average. Distributions of the number of countries by class intervals whenever considered relevant are also presented.

As a period of reference of trends over the years 1970 to 1974 the previous decade 1961-1970 was used. The First United Nations Development Decade, that is to say that of the 1960s. For this reason, the indicators appear as defined for that decade, for its second five-year period (1960-1970) as an additional factor of comparison, and for each one of the years comprising the decade. For the purpose of comparing the figures, the value of indicators for the decade and the five-year period mentioned are expressed in annual terms. They are, therefore, in the majority of cases annual averages; the exceptions are the variables of stocks, for which, instead of the average, their values for given years or the mid-points of the respective periods, 1965/1966 for the decade, and 1968 for the second five-year period, are used.

The indicators presented by country are grouped in five broadly defined areas: economic growth, human development and social change, internal effort, international trade and external financing. In each case the principal estimated variables are listed with an indication of the source of statistical information used, and an explanation of the principal technical division which had to be adopted for making the calculations.

1. Economic growth

In this area the macroeconomic information necessary for examining the rate of progress achieved in the implementation of the objectives of the International Development Strategy is presented. In addition, the targets specifically established in this document are included
- growth of overall income and per capita income, growth of imports

/and exports

and exports - as well as the variables which help to shape the macroeconomic framework of the countries and of the region, reflecting global supply and demand, the savings-investment process, external trade, and the evolution of prices.

The values obtained are based on data which, in general, are taken from the national accounts of the countries. It is well known that the quality of these data is not always satisfactory and for this reason they must be used with care. In this connexion, it should be recalled that the initial work on national accounts goes back to the closing years of the 1940s and the early 1950s, and that it was during the latter period that these estimates became important. Towards 1960, the majority of the countries of the region disposed at least of periodic series of the gross domestic product by branch of activity, by type of expenditure, generally at current and constant prices. The greatest advance in this respect was made during the 1960s: the calculations were strengthened and improved, the breakdown in terms of accounts and tables become more detailed, methodologies were established to make maximum use of the basic statistics available, new basic research was carried out, and competent technical cadres were trained. However, this apparently satisfactory trend is today over-shadowed by the growing unreliability of estimates and their failure to be prepared on time. The underlying causes of these defects are to be found in the weakening of basic statistical information and the lack, in many countries, of general long-term statistical plans which give adequate consideration to the information needs of national accounts, or the inadequacy of resources allocated for preparing them.

It can be said, therefore, that at the beginning of the 1970s the advance made in the field of national accounts in Latin America which had been observed in the previous decade showed signs of weakening, symptoms of which were: a longer delay in the accounts systems in the preparation of some of the complementary tables,

the lack of detail in the presentation of information and the deterioration in their reliability, caused by the fact that the basic statistics which were being used since the beginning of the 1960s 3/ were no longer representative.

Data on the external sector comes from the balance of payments which is by far one of the most organized areas of information and up to a certain point, more reliable.

Among the technical decisions which had to be taken, those connected with the international comparability of the indicators and the evaluation of prices. When an attempt is made to reflect the purchasing power of income in the various countries and in the region as a whole, parity exchange rates are used which show the relation between the levels of purchasing power of the respective currencies. The gross domestic product at factor cost which appears in the tables in this part of the document is calculated on this basis and ought, therefore, to be interpreted in this sense.

The parity exchange rates used correspond to measurements carried out in 1960s and adjusted taking account of the corresponding price indexes.4/

In other tables structural coefficients or those related to the product are included. In these cases it is accepted that the economic structure of the country is reasonably defined by the coefficients based on national accounts. Therefore, it does not

3/ On these aspects reference could be made to Las cuentas nacionales en América Latina. Desarrollo reciente, situación actual y perspectivas by Horacio Santamaría, XI Meeting of Central Bank Experts, Quito, Ecuador, November 1974.

4/ The secretariat has studied the technical aspects relating to the concept and determination of real income and the purchasing power of Latin American currencies and has published its finding in this respect. See Economic Bulletin for Latin America, vol. XII, Nº 2, October 1969, and Economic Survey of Latin America, 1968, United Nations Publication, Sales Nº: E70.II.G.1.

seem necessary to modify them using parity exchange rates since in this case it is not a question of purchasing power. The aggregation of the variables which are used for estimating the structural coefficients at regional level was carried out using for all of them the average exchange rates used in external trade in 1970.

All the previous indicators are expressed at constant 1970 prices. This seems satisfactory for a medium-or long-term appraisal of the development process, but it suffers the disadvantage that it ignores the changes in the price systems which could have significant effects on the structural coefficients. To reflect the rate of inflation the changes have been included in the consumer price index. This index has been used because although it is common knowledge that on its own it does not depict so complex a phenomenon as inflation, its use is widespread, and it is more accessible than other price indexes.

2. Human development and social change

This section includes a group of indicators which are aimed at presenting the characteristics of Latin America's social development in line with the guiding principles on the subject contained in the International Development Strategy. Thus the following areas are considered: demographic aspects and spatial distribution of the population, employment aspects, education, health, social security, housing, and consumption and nutrition. In each of these areas consideration is given to the indicators calculated on the basis of the available basic information.

The part dealing with demographic aspects and spatial distribution of the population includes indicators relating to the size and character of the population and the factors influencing population trends, inasmuch as they are basic factors of the economic and social structure for development. They help, on the one hand, to give some idea of the volume and nature of the demand for goods and services and, on the other, to determine the amount of manpower available to produce them. Therefore, data are presented for total population and its

rate of growth, population of active age (15 to 64 years) and the dependency ratio (number of persons of inactive age per 1,000 persons of active age), urban population (defined as population living in localities of 20,000 inhabitants or more), population living in cities of 100,000 inhabitants or more, and life expectancy at birth (average number of years that the new-born are expected to live). The rest of the indicators are expressed in terms of the variable concerned. Although the factors influencing population trends are the birth rate and the death rate, in view of the quality of the data it was decided to use the rate of growth of the population and life expectancy at birth (which could be taken essentially as an indicator of health conditions).

The part dealing with employment aspects presents data on manpower, one of the main factors of production. It shows the population's participation in economic activity by sector of production from two different angles: (i) the situation in specific periods, and (ii) within a dynamic context, the absorption of manpower resulting from each sector's growth.

Education is one of the key aspects of development. It can also be likened to a form of investment the importance of which increases in step with requirements in terms of the absorption, introduction and creation of technology. This dual role gives it a special place, since it not only contributes to the satisfaction of cultural needs, but also constitutes a factor similar to capital formation, related to human capital, the effects of which will be achieved over relatively long periods. Nevertheless, the indicators were taken into account considering education as an objective of development, even though they reflect the degree of the population's participation in the system rather than the extent to which the objective has been achieved. The indicators used here are, specifically, the illiteracy rate (percentage of illiterates in the population of 15 years and over), rates of enrolment (number of students enrolled as a percentage of the population of the appropriate school age) in primary, secondary and higher education, and the number of teachers per inhabitants of school age (7 to 24 years).

/As regards

As regards health conditions, another of the main development objectives, three indicators are given: the mortality rate of persons aged 1 to 4 years, number of inhabitants per doctor, and number of hospital beds per 1,000 inhabitants. Although the data presented are incomplete and not too reliable, it was considered essential, for purely illustrative purposes, to include some criteria for judging the health situation in Latin America, but the information must be taken with serious reservations. This is especially true of the last two indicators, since the figures for doctors and hospital beds are of doubtful accuracy. In an effort to up-date the information, recourse was had in some cases to different sources, which gave rise to sharp variations in the value of the indicators not necessarily reflecting changes in health conditions.

The data on social security include the percentage of the population participating in social security systems and the disbursements of these systems as a percentage of the gross domestic product.

Housing constitutes a serious problem for social development in the Latin American countries. The size of the housing shortage is such that it is not only difficult, not to say impossible, to find an immediate solution, but the prospects of a solution within a reasonable span are equally gloomy.

Owing to the lack of information and the quality of the available data, however, only partial aspects of the problem can be shown through the appropriate indicators. At the same time, it should be borne in mind that the international comparisons have only relative validity (because of differences in climate, traditions, family composition, etc.).

The indicators include an index of the degree of crowding (number of persons per room) and three indexes relating to the state of the dwellings: percentage of the population with drinking water, electric lighting and sewerage. Because of the quality of these data, the performance of these indicators should also be interpreted with some caution.

/Lastly, this

Lastly, this section includes indicators for consumption and nutrition, through which an attempt is made to quantify the trend of per capita consumption and the level of nutrition in terms of proteins and calories, but without considering the quality of the food or its distribution among the social groups. Since calorie requirements vary from country to country, an additional indicator is considered showing supply as a percentage of requirements. This last indicator may be used for international comparisons.

As regards the basic information available, a general appraisal of the production and use of social statistics in Latin America shows the wide gap that exists between what is required and what is available. The general features are the periodical conduct of population and housing censuses, usually every 10 years; a heterogeneous group of sectoral or specialized statistics such as those on education, employment, vital events, health, etc.; and lastly, as a recent contribution, continuous sample surveys of households in urban areas.

An analysis of the content and use of these data reveals a series of difficulties connected with them, e.g., the fact that they are generally not up to date, their limited reliability and the difficulty of obtaining through them a view of social development as an interconnected process. Population censuses, except for the preliminary results, are not usually available for use until the next census is about to be taken, and even then the possibility of having access to any data other than those included in the normal tabulation plans is remote. The continuous statistics are also characterized by their general lateness and unreliability, owing to the difficulty of access to unpublished details and because of the little or no interrelationship between them. Although they show aspects of social relationships in respect of which the various groups of individuals take up certain attitudes, it is usually impossible to link up the position of the social groups in the different areas covered, and also to identify the course of specific social groups over a period of time within a specific area. Both the interconnection and the course followed are, however, fundamental forms of observation for a unified approach to development.

Multi-purpose household surveys have emerged in recent years as a logical answer to these concerns, although so far their use has also been limited and has suffered from several of the above-mentioned ills. Their coverage has generally been confined to fairly important urban areas, the rapid and extensive availability of the data collected in these areas are usually limited for the same reasons as those described above, and in many cases the actual size of the samples sets a limit on the specialized use of the information. Lastly, and perhaps even more significant, there has not yet been a sufficiently fruitful meeting between the potential users of these data and the producers. In the light of the little empirical quantitative research carried out on the basis of data obtained from household surveys, however, some reflection is essential on the degree to which the type and content of continuous surveys are compatible with the theoretical budgets of sociology, on the characteristics of the data normally published, and on the possibilities of access to the original data. These questions probably have no single solution or answer, and the steps to deal with them should be taken by statisticians, sociologists and other users in such a way as to bring them closer together through what should be a fruitful dialogue.

One course which might be successfully adopted is that which emerges both from the unified concept of development, which affirms the need to unify or integrate aspects or elements that are generally considered individually or separately from the process, and from the systematic descriptions of aspects of the social process, based on interconnexions and interactions between individuals and their various activities. Although the lack of generally accepted theoretical models is still an impediment to the organization of social information, the possibility of analysing and describing the behaviour of society at different levels of aggregation on the basis of a better co-ordination and interrelation of the statistics currently compiled would seem to be a fruitful possibility.^{5/}

5/ The United Nations study entitled Towards a System of Social and Demographic Statistics (ST/STAT.68, 24 July 1973), arranged in accordance with the principles described here, shows the innumerable possibilities that can be visualized in the future.

Actually, for a better understanding of the operation of society in terms of the various groups it comprises, it would be useful to establish stratification criteria for identifying and observing the behaviour of one and the same social group in each area of interest. These criteria should be used in population census tabulations, and also perhaps in continuous household surveys between the censuses.

The indicators presented merely bring into focus some of the problems mentioned here. The data basically reflect the availability of population and housing censuses conducted around 1960 and 1970, supplemented by a heterogeneous, fragmentary and backward group of sectoral or specialized statistics on education, employment, health and vital events. The use of multi-purpose household surveys to obtain information on social development as an interconnected process continues to be a difficult objective.

3. The domestic effort

This section is divided into six parts: investment and productivity, agricultural sector, energy resources, manufacturing, trend of saving, and public financial resources. This area comprises a group of indicators related to the capital formation process, the sectoral origin of production and the evolution of the public sector.

For an evaluation of the capital formation process, use can also be made of indicators registered in the economic growth area, such as the ratio of gross domestic investment to the gross domestic product, and of domestic saving to gross domestic income.

For analytical purposes, the real and financial aspects of the process are presented separately, i.e., the indicators relating to investment in the part on investment and productivity, and those relating to saving in the part on the trend of saving. The data on investment cover its composition by type of investor (public and private) and by kind of capital good, machinery and equipment, and construction. Those on saving include its distribution into public and private, and domestic and external. It should be noted that

/the estimate

the estimate of gross domestic saving is not obtained directly, but is the result of estimates of gross capital formation, with the necessary adjustments for net external financing at constant prices. From a conceptual point of view, it would have been better if the savings coefficients had been available in terms of current prices, but it was not possible to obtain this information. All these indicators of distribution are defined as percentages of the respective total.

The part on investment and productivity also considers global indicators of productivity. Some relate to capital - the marginal capital-output coefficient - and others to total and sectoral employment.

The former is estimated on the basis of variations in investment and the gross domestic product, for want of estimates of the stock of capital, and it is particularly sensitive to short-term variations.

The average capital-output ratio is another singularly useful indicator for analysis and evaluation. Capital can be estimated by the permanent inventory method. Although such data are not presented here, this method is increasingly applicable for estimating capital the longer the period covered by the national accounts. Nearly all the Latin American countries possess detailed basic series for investment covering periods of more than 25 years and providing sufficient data to try out this methodology,^{6/} which, moreover, has been used by the ECLA secretariat in many of its studies.

The indicators of labour productivity refer, as is traditional, to the immediate relationship between production and employment. In this section, the net product per person employed is quantified for the economy as a whole, and is then used as a reference value for calculating the values of the product per person employed for the various sectors of the economy.

6/ Manuel Balboa and Alberto Fracchia, "Fixed reproducible capital in Argentina", in International Association for Research in Income and Wealth, The Measurement of National Wealth, Income and Wealth Series, Bowes and Bowes, London, 1959.

It should be noted that this indicator can be determined by various methods; the simplest is that presented here of counting the total number of persons employed with no weighting of any kind; another more sophisticated method would be to combine those persons according to their relative remuneration, but the necessary information for this is not available. Therefore, it is essential to take these different concepts into account in order to make proper use of this indicator in the tasks of analysis and evaluation.

Many of the problems arising in the development process are connected with the nature and importance of the main productive activities. For example, the slow growth of the agricultural sector and the dynamism of manufacturing are traditional characteristics. It is therefore necessary to have the proper elements to undertake the evaluation at the sectoral level. Without losing sight of the fact that each and every one of the economic sectors is important, for the sake of simplicity detailed indicators are included only for agriculture, manufacturing and energy resources.

In the case of agriculture and manufacturing, estimates are given for their share in the total product, and their growth rates. In order to link sectoral output with the external sector, one indicator presented is the share of the exports of goods produced by each sector in total exports of goods. This percentage was calculated in terms of values at current prices. An additional indicator is considered for manufacturing: the share of metal manufactures and machinery in total manufacturing output. This sectoral indicator is closely bound up with the stage of economic development reached.

In connexion with energy resources, indicators are presented for commercial energy, electric energy and petroleum. Thus the per capita consumption of electric energy is given in kilogrammes of petroleum equivalent, the total production of electric energy in millions of kWh, the electric energy generated per unit of gross product in kWh per dollar, the installed capacity of electric energy per inhabitant in watts, and the per capita consumption of electric

/energy in

energy in kWh. The data indicators for petroleum include total output of crude, per capita consumption of petroleum products and natural gas, and daily refining capacity, all of which are expressed in cubic metres. Moreover, with the purpose of linking the evaluation of the sector with that of the economy as a whole, the rates of growth of commercial energy consumption were included.

The last group of indicators presented in this section refers to public financial resources. Actually, some aspects of general government activity are shown with a view to determining their relative importance within overall economic activity. Indicators are included for tax collection in relation to the gross domestic product, both in terms of coefficients for specific periods and through the elasticity of the tax system, within a dynamic context, which shows the degree of flexibility of tax income in relation to the growth of the product. In the same way, the composition of tax income is shown by type of tax: direct, indirect taxes on foreign trade, and other indirect taxes. Moreover, current government expenditure and government consumption expenditure are given as a percentage of the gross domestic product.

Most of the basic information used for these indicators, except the data on energy resources and exports, was obtained from the national accounts. As with the macroeconomic indicators, they are based on values at 1970 prices and are expressed in gross figures. Nevertheless, the indicators for public financial resources and the coefficients for the share of sectoral exports in total exports of goods are calculated on the basis of values at current prices.

4. International trade

This and the following section include the group of indicators for evaluating the external sector. They are presented broadly in line with the content of the balance of payments, although they include more detailed information on some points. The indicators considered reflect current transactions grouped under the head of goods; structure of imports of goods; exports, imports and trade balance by economic areas; expansion of intra-regional trade; freight, insurance and maritime transport; and tourism. It will be remembered that in the section on economic growth and in the part dealing with agriculture and manufacturing some indicators were included for the external sector. In order to avoid any overlapping, the indicators given here are supplemented by those mentioned above as a basis for evaluating foreign trade.

The part dealing with goods transactions includes exports and imports in absolute terms, their growth rates, and indexes of their unit values.

Under the head of structure of imports of goods, imports, classified by economic use and destination, are presented as a percentage of total imports of goods. They are divided into consumer goods, fuels and lubricants, raw materials, intermediate products and construction materials, and capital goods.

In order to make the indicators consistent, the overall import and export figures were taken from the balances of payments. On the other hand, the distribution by type of good is based on statistics from the customs records. Although these records were also the original source of information for the balance of payments, the relevant totals are not always the same, because of the corrections introduced in the basic figures (for example, adjustments in valuation, for contraband, etc.) with the object of including them in the balance of payments. In the part relating to trade by economic area, the trade of Latin America and of each country in the region is considered together with that of the various economic areas in the world. The United States, the European Economic Community, Japan and the socialist countries are shown separately.

The indicators for intra-regional trade show commercial transactions, exports and imports of Latin America and each individual country, with the main economic areas of the region. Those considered are the Latin American Free Trade Association (LAFTA), the Andean Agreement and the Central American Common Market. In addition to the value of exports and imports, the importance of intra-regional trade is established in relation to the total trade of each country or of the region, as the case may be. Similarly, the rate of growth of transactions is considered for each of these areas.

The transport indicators include, on the one hand, the amount of income and expenditure under the head of freight, insurance and other transport, and as a percentage of exports and imports of goods and services, respectively, and, on the other hand, the number of ships of over 1,000 gross registered tons in the Latin American fleet and their cargo capacity.

In the part on tourism, an attempt has been made to show this movement through income and expenditure under this head. It presents values in dollars at current prices, the share of income in exports of goods and services, and the share of expenditure in imports of goods and services.

5. External financing

This section presents a group of indicators aimed at showing the various forms taken by the international movement of capital. It not only includes the net flow of resources, but also in some cases the gross international capital flows. The first three indicators reveal the scale of external financing in millions of dollars, the part it plays in financing imports of goods and services, and its role in supplementing gross domestic saving in the financing of investment. In these last two cases it is expressed as a percentage of imports and of gross domestic investment, respectively.

The remaining indicators show the salient characteristics of the mobilization of external resources. Thus the gross inflow of capital is presented, in millions of special drawing rights, followed by some of its components: direct foreign investment, also in millions of SDRs, and medium- and long-term non-compensatory loans expressed as a percentage of the gross inflow of capital.

Next, an attempt is made to underline the significance acquired by the servicing of foreign capital in the Latin American countries, with an indicator showing the relative importance of the payments in respect of the amortization and interest on the external debt and remittances of profits on direct foreign investment as a percentage of exports of goods and services.

To supplement this is included the net contribution of autonomous foreign financial resources in millions of dollars. This is obtained by deducting the payments under the head of interest on loans and remittances of profits on direct foreign investment from the gross autonomous inflow of foreign capital. Note that this is the contribution deriving from non-compensatory capital movements.

The last indicator refers to the cumulative balance of the external public debt disbursed and is presented in millions of dollars.

6. Regional tables

As pointed out above, in addition to the tables presenting detailed information by countries, some tables are included with indicators calculated only for the region as a whole. Each table includes several interrelated indicators aimed at providing a fairly integrated view of a given situation. These tables are intended to supplement the description of the indicators by countries and relate to the following subjects:

(i) Global aspects of growth: summarizes the main macroeconomic indicators of the region. Considers the value of the gross domestic product, total and per capita, in dollars at 1970 prices; ratios of consumption, investment, exports and imports to the gross domestic product; annual rates of growth of these variables; elasticity of exports and imports of goods and services in terms of the product; and the sectoral structure of the gross domestic product.

(ii) Production

(ii) Production in manufacturing industry: shows the structure of manufacturing production by branches of industry, and the growth rate of manufacturing production, total and by branches.

(iii) Imports of goods classified by economic use or destination: presents imports of goods classified as durable consumer goods, non-durable consumer goods, fuels and lubricants, raw materials, intermediate products and construction materials, capital goods, and others. Shows both the value of imports of each group in millions of dollars and their composition in terms of percentages of the total.

(iv) Maritime transport: presents a group of indicators for the Latin American fleet, the cargo carried and the freight rates paid for it, showing the export and import cargo separately. Also includes the deficits in trade transactions on the balance of payments and the construction of ships in Latin America.

(v) External financing: reflects the trend of the main variables of the external sector for Latin America as a whole. Different tables present current transactions, capital movements and the external debt. Determines both the value of the transactions and their relative importance. In the case of current transactions - divided into goods, freight and insurance, travel, investment income, transfer payments and balance - in relation to the current inflow of foreign exchange; for the movement of capital - in which the flow of resources is divided into autonomous and compensatory, showing the main types of non-compensatory financing - in relation to the respective totals; and, lastly, for the external public debt - including the outstanding balance and servicing - in relation to exports of goods and services. The structure of the debt by type of creditor is also considered.

Chapter II

INDEX AND VALUES OF INDICATORS

ECONOMIC GROWTH

1. Total gross domestic product (annual average, millions of dollars at 1970 prices)
2. Growth rate of the total gross domestic product (annual rates, percentages)
3. Per capita gross domestic product (annual average, dollars at 1970 prices)
4. Growth rate of the per capita gross domestic product (annual rates, percentages)
5. Imports of goods and services (annual average, millions of dollars at 1970 prices)
6. Growth rate of imports of goods and services (annual rates, percentages)
7. Exports of goods and services (annual average, millions of dollars at 1970 prices)
8. Growth rate of exports of goods and services (annual rates, percentages)
9. Purchasing power of exports of goods and services (annual average, millions of dollars at 1970 prices)
10. Growth rate of purchasing power of exports of goods and services (annual rates, percentages)
11. Investment coefficient (percentages of the gross domestic product at 1970 prices)
12. Gross national savings coefficients in terms of the gross domestic product (percentages of the gross domestic product at 1970 prices)
13. Coefficients of imports of goods and services in terms of the gross domestic product (percentages of the gross domestic product at 1970 prices)
14. Coefficients of exports of goods and services in terms of the gross domestic product (percentages of the gross domestic product at 1970 prices)
15. Changes in consumer prices (annual rates, percentages)
16. Terms of trade in goods and services (1970 = 100.0)

HUMAN DEVELOPMENT AND SOCIAL CHANGE

A. DEMOGRAPHIC ASPECTS AND SPACIAL DISTRIBUTION OF THE POPULATION

1. Total population (thousands of persons)
2. Growth rate of the population (annual growth rates, percentages)
3. Life expectancy at birth (years)
4. Population of active age (percentages of the total population)
5. Dependency ratio (persons of non active age per 1,000 persons of active age)
6. Urban population (population living in urban areas of 20,000 inhabitants or more, percentages of the total population)
7. Population living in cities of 100,000 inhabitants or more (percentages of the urban population)

B. EMPLOYMENT ASPECTS

1. Population employed by sector (percentages of total employed population)
2. Absorption of the increase in employment by sector (percentages of the total increase in employment)

C. EDUCATION

1. Illiteracy rate (percentage of illiterates in the population of 16 years of age and over)
2. Rate of enrollment in primary education (students enrolled as a percentage of the population between 7 and 13 years of age)
3. Rate of enrollment in secondary education (students enrolled as a percentage of the population between 14 and 19 years of age)
4. Rate of enrollment in higher education (students enrolled as a percentage of the population between 20 and 24 years of age)
5. Number of teachers per 10,000 inhabitants of school age (7 to 24 years of age)

D. HEALTH

1. Infant mortality rate (number of deaths per 1,000 inhabitants between 1 and 4 years of age)
2. Number of inhabitants per doctor
3. Hospital beds per 1,000 inhabitants

E. SOCIAL SECURITY

1. Persons insured under social security systems cover major risks as a percentage of the economically active population
2. Disbursements of the social security systems as a percentage of the gross domestic product at factor cost

F. HOUSING

1. Average number of persons per room
2. Percentage of the urban population with drinking water
3. Percentage of the rural population with drinking water
4. Percentage of the urban population with sewerage facilities
5. Percentage of the total population with electric lighting

G. CONSUMPTION AND NUTRITION

1. Growth rate of private consumption per inhabitant (annual rates, percentages)
2. Daily intake of calories per inhabitant
3. Daily intake of proteins per inhabitant (grams)
4. Supply of calories as a percentage of average requirements

THE DOMESTIC EFFORT

A. INVESTMENT AND PRODUCTIVITY

1. Marginal gross capital-product ratios (estimates on the basis of dollars at 1970 prices)
2. Investment in construction (percentages of gross fixed investment at 1970 prices)
3. Investment in machinery and equipment (percentages of gross fixed investment at 1970 prices)
4. Public investment (percentages of gross fixed investment at current prices)
5. Gross domestic product per person employed (dollars at 1970 prices)
6. Product per person employed by sector (average for the economy = 100)

B. AGRICULTURAL SECTOR

1. Share of the agricultural sector in the generation of the product (percentage of the total gross domestic product at 1970 prices)
2. Growth rate of the agricultural sector (annual rates, percentages)
3. Elasticity of the agricultural sector in terms of the gross domestic product (ratios between annual growth rates)
4. Share of agricultural exports in total exports of goods (percentages)

C. ENERGY RESOURCES

1. Total production of electrical energy (millions of kWh)
2. Electrical energy generated per unit of gross domestic product (kWh per dollar)
3. Installed capacity of electrical energy per inhabitant (Watts)

4. Consumption of electrical energy per inhabitant (kWh)
5. Production of crude petroleum (millions of m³)
6. Consumption of hydrocarbons (petroleum products and natural gas) per inhabitant (1 kg of petroleum is equal to 10,700 kcal/kg)
7. Petroleum refining capacity (thousands of m³ per day)
8. Consumption of commercial energy per inhabitant (1 kg of petroleum is equal to 10,700 kcal/kg)
9. Growth rate of consumption of commercial energy (annual rates, percentages)

D. MANUFACTURING

1. Share of the manufacturing industry in the generation of the gross domestic product (percentage of the total gross domestic product at 1970 prices)
2. Growth rate of the manufacturing industry (annual rates, percentages)
3. Elasticity of the manufacturing industry in respect of the gross domestic product (ratios between annual growth rates)
4. Share of exports of manufactures in total exports of goods (percentages)
5. Share of metal manufactures and machinery industries in the generation of the industrial production (percentages)

E. TREND OF SAVINGS

1. Ratio of gross national savings to gross national income (percentages at 1970 prices)
2. Share of gross national savings in the financing of investment (percentages at 1970 prices)
3. Ratio of central government savings to gross national savings (percentages at 1970 prices)

F. PUBLIC FINANCIAL RESOURCES

1. Tax collection (percentages of the gross domestic product at current prices)
2. Current central government expenditure (percentages of the gross domestic product at current prices)
3. Central government consumption expenditure (percentage of gross domestic product at current prices)
4. Taxes deriving from foreign trade (percentages of total tax collection)
5. Direct taxes (percentages of total tax collection)
6. Indirect taxes including those deriving from foreign trade (percentages of total tax collection)

INTERNATIONAL TRADE

A. GOODS TRANSACTIONS

1. Exports of goods (FOB) (annual average, millions of dollars)
2. Imports of goods (FOB) (annual average, millions of dollars)
3. Growth rate of exports of goods (annual rates based on dollars at current prices, percentages)
4. Growth rate of imports of goods (annual rates based on dollars at current prices, percentages)
5. Unit value of exports of goods (1970 = 100)
6. Unit value of imports of goods (1970 = 100)
7. Terms of trade in goods (1970 = 100)

B. STRUCTURE OF IMPORTS OF GOODS

1. Share of consumer goods in total imports of goods (percentages)
2. Share of fuels and lubricants in total imports of goods (percentages)
3. Share of raw materials, intermediate products and construction materials in total imports of goods (percentages)
4. Share of capital goods in total imports of goods (percentages)

C. TRADE BY ECONOMIC AREA

1. Exports (annual average, millions of dollars)
2. Imports (annual average, millions of dollars)
3. Trade balance (annual average, millions of dollars)

D. EXPANSION OF INTER-REGIONAL TRADE

1. Value of commercial transactions (annual average, millions of dollars)
2. Intra-regional trade as a percentage of the total
3. Growth rate (annual rates on the basis of dollars at current prices, percentages)

E. TRANSPORT

1. Revenue from freight, insurance and other transport facilities (annual average, millions of dollars)
2. Share of revenue from freight, insurance and other transport facilities in exports of goods and services (percentages)
3. Expenditure on freight, insurance and other transport facilities (annual average, millions of dollars)
4. Share of expenditure on freight, insurance and other transport facilities in imports of goods and services (percentages)
5. Fleet of ships of over 1,000 gross registered tons (number of ships)
6. Freight capacity of ships of over 1,000 gross registered tons (thousands of GRT)

F. TOURIST TRADE

1. Revenue from tourism (annual average, millions of dollars)
2. Share of revenue from tourism in exports of goods and services (percentages)
3. Expenditure on tourism abroad (annual average, millions of dollars)
4. Share of expenditure on tourism abroad in imports of goods and services (percentages)

c) others	12.9	13.3	12.4	12.1						

Note: For lack of information, this table does not include Cuba.

a/ 1966.

b/ 1969.

c/ Excluding Barbados and Haiti.

d/ In respect of the balance as at 31 December 1965.

e/ In respect of the balance as at 31 December 1968.

Annex

Sources of basic information used in the calculation
of the indicators

<u>Area, chapter and indicator</u>	<u>Source</u>
I. ECONOMIC GROWTH	
1. Total gross domestic product	ECLA, on the basis of national statistics
2. Growth rate of the total gross domestic product	ECLA, on the basis of national statistics
3. Per capita gross domestic product	ECLA, on the basis of national statistics
4. Growth rate of the per capita gross domestic product	ECLA, on the basis of national statistics
5. Imports of goods and services	ECLA, on the basis of International Monetary Fund, <u>Balance of Payments Yearbook</u>
6. Growth rate of imports of goods and services	ECLA, on the basis of International Monetary Fund, <u>Balance of Payments Yearbook</u>
7. Exports of goods and services	ECLA, on the basis of International Monetary Fund, <u>Balance of Payments Yearbook</u>
8. Growth rate of exports of goods and services	ECLA, on the basis of International Monetary Fund, <u>Balance of Payments Yearbook</u>
9. Purchasing power of exports of goods and services	ECLA, on the basis of national statistics and IMF information
10. Growth rate of the purchasing power of exports of goods and services	ECLA, on the basis of national statistics and IMF information
11. Investment coefficients	ECLA, on the basis of national statistics
12. Gross national savings coefficients	ECLA, on the basis of national statistics
13. Import coefficients	ECLA, on the basis of national statistics and IMF information
14. Export coefficients	ECLA, on the basis of national statistics and IMF information
15. Changes in consumer prices	ECLA, on the basis of IMF, <u>International Financial Statistics</u>
16. Terms of trade index	ECLA, on the basis of national statistics

II. HUMAN DEVELOPMENT AND SOCIAL CHANGE

A. Demographic aspects and spatial distribution of the population

ECLA, on the basis of CELADE, Demographic Bulletin N° 13

B. Employment aspects

ECLA, on the basis of information supplied by PREALC, OIT and national censuses

C. Education

ECLA, on the basis of information supplied by the Inter-American Statistical Institute (America in figures), UNESCO, IDB and national statistical publications

D. Health

ECLA, on the basis of information supplied by the Pan American Health Organization (Las condiciones de salud en las Américas and Proyecciones cuadriennales 1972-1975), the Pan American Health Centre and CELADE

E. Social Security

ECLA, on the basis of national statistics

F. Housing

ECLA, on the basis of information supplied by the United Nations Statistical Office, the Pan American Health Organization, CELADE and national statistics

G. Consumption and nutrition

ECLA, on the basis of FAO information and national statistics

III. THE DOMESTIC EFFORT

A. Investment and productivity

ECLA, on the basis of national statistics and PREALC information

B. Agricultural sector

ECLA, on the basis of FAO information

C. Energy resources

ECLA, on the basis of national statistics

D. Manufacturing

ECLA, on the basis of national statistics

E. Trend of savings

ECLA, on the basis of national statistics

F. Public financial resources

ECLA, on the basis of national statistics

IV. INTERNATIONAL TRADE

A. Goods transactions

ECLA, on the basis of IMF,
Balance of Payments Yearbook

B. Structure of imports of goods

ECLA, on the basis of national
statistics

C. Trade by economic area

ECLA, on the basis of IMF,
Direction of International Trade,
and national statistics

D. Inter-regional trade

ECLA, on the basis of information
supplied by LAFTA, SIECA and
national statistics

E. Transport

1. Revenue from freight,
insurance and other
transport facilities

ECLA, on the basis of IMF, Balance
of Payments Yearbook

2. Share of revenue from
freight insurance and
other transport facilities
in exports of goods and
services

ECLA, on the basis of IMF, Balance
Payments Yearbook

3. Expenditure on freight,
insurance and other
transport facilities

ECLA, on the basis of IMF, Balance
of Payments Yearbook

4. Share of expenditure on
freight, insurance and
other transport facilities
in imports of goods and
services

ECLA, on the basis of IMF, Balance
of Payments Yearbook

5. Fleet of ships of over
1,000 gross registered tons

ECLA, on the basis of information
supplied by the Instituto de
Estudios de la Marina Mercante
Iberoamericana

6. Freight capacity of ships
of over 1,000 gross
registered tons

ECLA, on the basis of IMF
information

F. Tourist trade

V. EXTERNAL FINANCING

- | | | |
|--|---|---|
| 1. Net external financing | ECLA, on the basis of IMF,
<u>Balance of Payments Yearbook</u> | |
| 2. Ratio of net external financing to imports of goods and services | ECLA, on the basis of IMF,
<u>Balance of Payments Yearbook</u> | |
| 3. Share of net external financing in gross domestic investment | ECLA, on the basis of IMF information and official statistics | |
| 4. Ratio of net external financing to gross national income | ECLA, on the basis of IMF information and official statistics | |
| 5. Direct external investment | } | ECLA, on the basis of IMF,
<u>Balance of Payments Yearbook</u> |
| 6. Gross inflow of external capital | | |
| 7. Medium-and long-term autonomous loans | | |
| 8. Payment of amortization and interest on external loan and remittance of profits on direct external investment | | |
| 9. External public debt | ECLA, on the basis of World Bank information | |
| 10. Net contribution of external capital | ECLA, on the basis of IMF,
<u>Balance of Payments Yearbook</u> | |
